FULL_REZZ 3.0 – Quick start

Delivery revision 2026-10-14.2. Windows 10/11 x64 release candidate; native Windows acceptance remains pending.

1. Download FULL_REZZ_3.0_Start_Here.zip and every matching FULL_REZZ_3.0_Setup.partNN. Extract Start_Here beside the parts. Run Assemble_Installer.cmd; it verifies part sizes/checksums and the reconstructed EXE. Do not mix revisions or older installer parts.

2. Run FULL_REZZ_3.0_Offline_Windows_x64_Setup.exe and select the language/program folder. It contains the runtime, models, fonts and codecs. Allow at least 12 GB free space; keep the installer for repair. No external Python, Node, model service, API key or first-run download is required.

3. Open FULL_REZZ. Keep the workspace outside the installed program. Select Character companion and the intended stable profile. The supplied Rebecca pack is one unmeasured 2D cel; Studio Unit is an original neutral 3D demonstration.

4. Import chat history with explicit role mappings where needed. Use Send and speak for a new local reply and speech. Generation may take minutes on CPU. A speech failure keeps the reply; Retry speech uses that same turn.

5. Select supported 2D/3D views and inspect the camera/action controls. Export companion movie at 60, 120 or 240 fps. Audio energy drives the mouth; output fps does not reconstruct missing poses or unseen anatomy.

6. Review voice ratings, geometry and frame flags separately. Back up the editable workspace before moving or upgrading. Uninstall preserves the separate workspace.

F5 conditioning supports English/Mandarin. Generic eSpeak speech is experimental in twelve languages and does not imitate a character. Interface/reply/transcription/synthesis choices are independent. Human likeness and art review remain required.

Replit: import FULL_REZZ_Replit_Engram_Fileset.zip and give TASK_QUERY.md to Agent. The starter inspects data without inference. A browser host requires its own presenter; Qt runs natively. Read Replit_Integration_Guide.md and the complete User_Guide.pdf.

Troubleshooting: preserve startup_error.log and failed receipts, use the matching complete installer for repair, and read User_Guide.md. Clean Windows installation, device playback, GPU pacing, repair/upgrade and uninstall still require target-machine testing.
