FULL_REZZ 3.0 - Product audit

14 October 2026; delivery revision 2026-10-14.2. Release candidate: source implementation is incorporated; native Windows acceptance, character artwork and voice-acting approval remain open.

Preserved implementation evidence

The saved 13 October baseline records 117 renderer/bridge/companion checks and 108 native voice checks passing. The actual local Qwen text model produced a reply and F5 generated its delivered speech; the short three-word check passed with 0% word error. Two additional unseen replies also generated new speech; their separate text-check receipts are retained. This does not approve representative acting or voice likeness. The first restored attempt failed because the Linux test environment had an incompatible Transformers version; that receipt is retained. The matching pinned version fixes the dependency failure.

The new neutral 3D benchmark contains 720 decoded frames at 60 fps and six genuine camera views. The new Rebecca clip couples her supplied 2D cel to actual newly generated speech. Original WAVs and source/model identities are retained. The body-preservation comparison removes unsupported broad hand deformation; it does not reconstruct a missing shoulder or sidestep.

This rebuild

All 117 core and 108 native voice checks pass again. Native Qt opens nine tabs, renders actual supplied 2D pixels, shares its workspace/profile across embedded and detached views, and switches all twelve locales including Arabic RTL. Installer transaction fixtures pass. Current execution receipts are under evidence/rebuild_20261014/. The rebuild restores source bytes atomically, repairs and verifies the predecessor F5 weight, aligns guides/API/localization, checks native Qt startup, rebuilds the complete installer and verifies its actual extraction transaction. New neural speech generation and target-machine Windows execution are not inferred from these packaging checks. Historical neural/audio/media evidence remains dated and separate.

Requirements ledger

Issue	Current status	Result
FR-A01	Implemented; artistic acceptance pending	New 720-frame exports, different hashes and native synchronized before/after controls.
FR-A02	Implemented controls; character artwork still limited	Unsupported broad arm influence disabled; exact protected-geometry checks pass; neutral rig has separate shoulder/elbow/wrist joints. Rebecca needs authored parts and corrective poses.
FR-A03	Open artwork review	40 current flags retained with unchanged thresholds. Removal of unsafe warping exposes larger authored-pose jumps; no artist rationale or blanket approval has been invented.
FR-A04	Implemented; character view coverage pending	Shared six-shot timeline and actual camera orbit; original 720-frame 60 fps neutral-rig movie. Rebecca remains one supplied unmeasured view.
FR-A05	Implemented supported subset	glTF/GLB triangle surfaces, depth, base-color textures, skinning and TRS clips; actual OpenGL shader path tested. PBR, compressed extensions and morphs are outside the supported subset.
FR-A06	Implemented	Canonical 1.0.0 format, checked imports, stable profile bindings and explicit unsupported mode/view errors.

Issue	Current status	Result
FR-A07	Implemented	Atomic full-history SQLite import, source byte/hash retention, explicit CSV/text mappings, pagination and complete export. Context retrieval does not delete stored history.
FR-A08	Implemented local/provider core; host incorporation pending	Actual bundled Qwen/llama.cpp text generation; validated host callback adapter. The ENGRAM repository has not been supplied or edited.
FR-A09	Implemented energy-driven performance; acting review pending	Actual F5 speech drives sample-clock mouth motion; new voiced 2D movie. Alignment is energy-only, not phonemes.
FR-A10	Implemented shared widget; Windows/device acceptance pending	Same session/identity core in embedded Qt panel and separate native window; Linux offscreen startup exercised.
FR-A11	Installer rebuilt; native acceptance pending	One internally complete installer with private runtime and 20 local model assets. Archive/hash validation is distinct from Windows loader/install acceptance.
FR-A12	Measurement tools implemented; target-machine gate open	Async workers, cancellation lifetime, 120 Hz presentation target, saved viewport observations and independent completed-frame GPU-path test. No ROG pacing guarantee.
FR-A13	Original benchmark implemented; art comparison pending	Actual six-shot geometry benchmark, new 60 fps media and explicit anatomy/cinematography criteria. No Studio Trigger fidelity score.
FR-A14	Implemented local review workflow	Transcript-to-issue ledger retained; current evidence and remaining inputs recorded without optional web lookup blocking local work.

Remaining visual evidence

The current body-preservation audit has 11 technical passes and 0 failures, with **40 open artistic flags** (24 silhouette_change, 16 hand_landmark_jump). The preceding export had 32 flags: 26 silhouette and six hand flags. Removing unsafe Gaussian warping exposes larger jumps between some supplied poses. This is not claimed as a fully smoothed or studio-equivalent animation. Review docs/FULL_REZZ_Current_Frame_Review_Queue.csv without relaxing the thresholds. Rebecca still requires calibrated missing views, articulated parts/corrective poses and a usable 3D rig.

Acceptance gates

On Windows, perform clean installation with networking unavailable, startup, full-history import/export, several new conversations, audio-device playback, 2D/3D switches, camera orbit, live pacing, worker cancellation, restart, upgrade/repair and uninstall/data preservation. The environment used here is Linux; package extraction, compiled PE inspection and offscreen Qt checks cannot replace these tests. No signed-in Replit run or unseen host repository incorporation is claimed.

For artwork, review silhouette, joints, hand/prop contacts, foot contacts, acting, arcs, perspective, lighting and transitions. For audio, review likeness, intelligibility, pronunciation, naturalness and delivery. Preserve failed automated results and human ratings independently. No pretrained weights were retrained, no sentience/neural plasticity was established and no proprietary studio assets were inferred as available.

Evidence

Current receipts, tests and measurements: evidence/product_v3/. Current movies/audio: product_exports/. Previous audit and transcript remain historical materials in docs/. The installer verification and delivery manifest record final bytes independently of this audit. Source licensing includes the unchanged noncommercial F5 weight terms and Qt/eSpeak corresponding sources.
